## Table of Contents

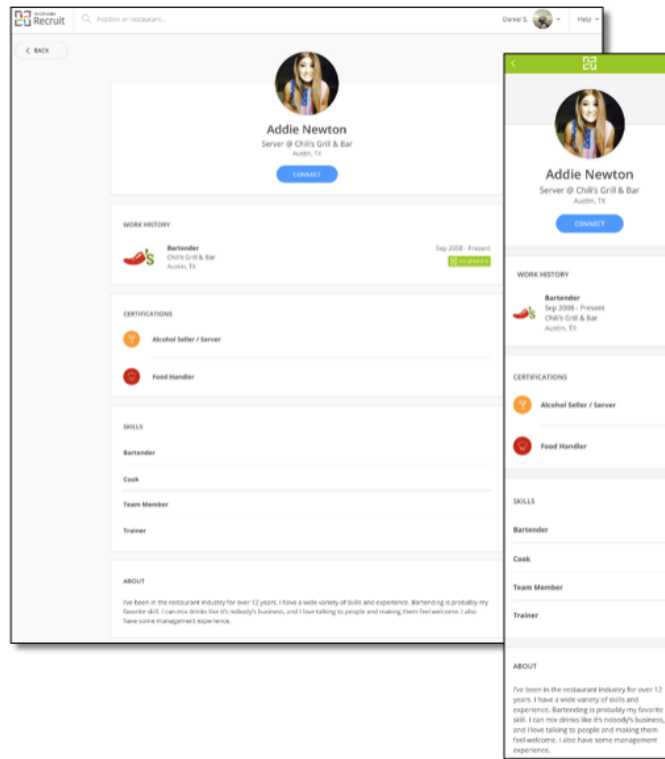

<b>New Features &amp; Improvements   Web</b>	2
Viewing Connection Profiles	2
Cropping Tool Improvements	4
Connection and Referral JSPs	4

# New Features & Improvements | Web

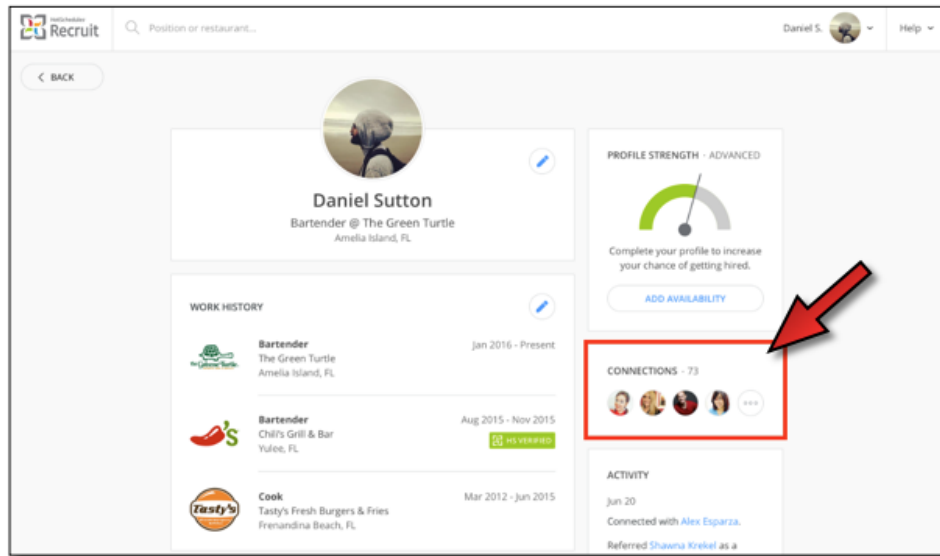

## Viewing Connection Profiles

The Profile area continues to receive updates including viewing the profile details, other users' profiles, and Connections.

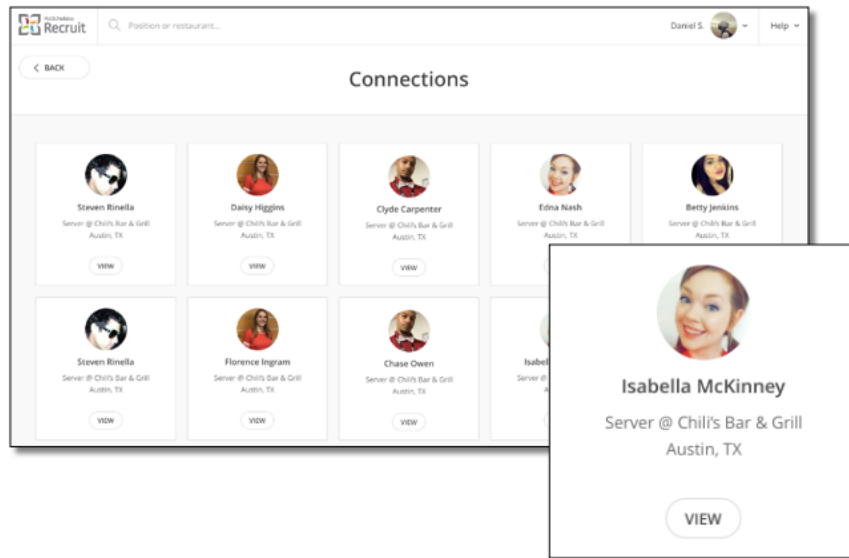

Whether users are on the web or a mobile device, when they click another user's profile, they can view the information (profile picture, location, work history, etc.).

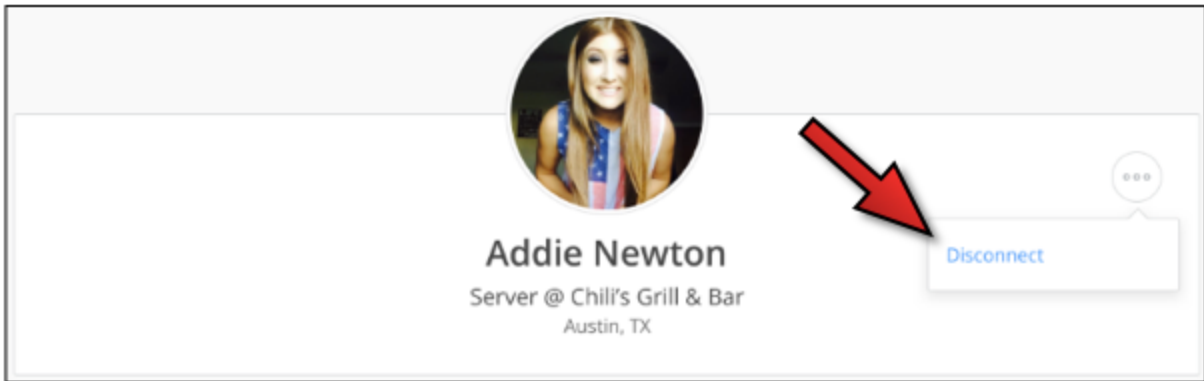

Users are able to view a list of their Connections from their Profile.

While viewing the list, clicking **View** will take users to the profile of the Connection.

Whether or not users are connected with each other, when viewing a profile, clicking the 3-Dot menu provides the option to send a connection invite, or to disconnect if already connected.

## Cropping Tool Improvements

Improvements have been made to the Cropping Tool when uploading a profile image. Recruit allows .jpeg, .jpg, .png, and .gif files no greater than 4 MB in size. Once uploaded, users can move the cropping circle over their image, and zoom in or out by clicking the corners of the tool. Users are able to expand the circle to the edges of the original photo, but are not able to decrease the size to less than 320 x 320 pixels.

## Connection and Referral JSPs

Previously, when users received a Recruit email asking them to respond to various actions, clicking the links in that email brought the users to a JSP asking them to accept or deny the action. Now, instead of being presented with a dead-end screen, the users are taken to directly into the Recruit web app.
